

Over 90% of the people totally rely on the drugs because they are told by drug companies and doctors (allopath-drug prescribing doctors) to take them, People are afraid to stop taking their ineffective prescription drugs that do not work, When people are using herbs and/or supplements it starts a cleansing process, which makes them, feel ill. The cleansing process causes them to stop using the effective medicinal herbs and/or supplements and to continue taking the drugs that do not work.

When they stop the use of prescription drugs and start taking herbs, it causes a drug withdrawal illness feeling. This causes them to say the herbs made them sick. Therefore they restart taking their drug to stop the withdrawal sickness symptoms from the drug. A drug withdrawal sick feeling episode convinces them that the drugs that do not work are working, They confuse stopping drug withdrawal symptoms with the healing action of the medicinal drugs that do not work They confuse the biochemical imbalance caused by the drug and their body's attempt to re-establish biochemical balance by fighting to rid the body of the drug with the medicinal effect of the drug that does not work.

The drugs poison the body and stop it from reacting. This stops the primary disease symptoms, which temporarily creates a secondary disease that has its own signs and symptoms of disease. However, the drug causes the deterioration of the health and creates a secondary disease. The secondary and other diseases caused by the drugs that do not work are usually called complications of the primary disease in which the drugs were prescribed for.

People usually stay alive despite the drug or die because the drug has killed them, However, if the patient lives the drug is thought to be life saving.

If the patient dies, it is from complications, or it was God's will or it was time for the person to die.

Either conclusion for the prescription drug murder makes the drug and doctor innocent of the crime of poisoning the patients. People will continue to believe that the drugs work even though the FDA, NSA-NRC, APHA, NCSC and common sense tells them that a poison cannot help you. You should not take something (drug) that hurts you and believe it is helping you.
